ABSTRACT

A personal computer health administration framework is disclosed that includes a set of intercommunicating components. The system includes a provider subsystem that provides services relating to personal computer health status. The services include acquiring health status information relating to the operation of the personal computer. The system also includes a health engine subsystem that receives and processes the health status information acquired by the provider subsystem. The health engine subsystem thereafter renders health status notifications. A client user interface subsystem, consumes the notifications of the health engine subsystem and reports personal computer health status information to users in accordance with the health status notifications.
